John Doyle

Outline

Background

- ❑ Trapping and cooling
- ❑ Laser cooling: applications and limitations

Buffer gas cooling: Techniques and applications

- ❑ Advantages over laser cooling
- ❑ Basic physical principles
- ❑ Technical challenges and solutions
- ❑ Trapping $1\mu_B$: Li, Cu, Ag
- ❑ Future Experiments: Non-S state atoms and further cooling

Why am I here today?

- ❑ Transition to sustainable energy science
- ❑ Activities of PV@MIT

Trapped Atom Science

- ❑ Study quantum behavior near absolute zero temperature
- ❑ Precision measurement
 - ❑ Atomic clocks
- ❑ Quantum information
 - ❑ Manipulate quantum states for computing and secure communication
- ❑ Simulate solid state systems
 - ❑ High T_C superconductors

Trapping and Cooling

Trapping requires cooling!

Laser Cooling: A Common Approach

Photon Scattering

Must be able to scatter many photons per atom

Ideally your atom is a two level system: After emission your atom is back where it started, waiting to be cooled further.

Laser Cooling Limitations

Complex structure makes laser cooling a challenge for most atomic species

Buffer Gas Cooling

Not dependent on internal states.

You can cool all kinds of species (including molecules)!

But can you trap everything?

Magnetic Trapping

Hydrogen Hyperfine Levels

Atom	$\sim \mu_{\text{atom}} (\mu_B)$
H, Li, Na Cu, Ag, Au	1
$^4\text{He}^*$	2
N, Bi, Pr	3
Ni	5
Cr, Fe, Co	6
Ho	9
Dy	10

Magnetic Trapping

$$\eta = \frac{\mu_{atom} B_{trap}}{k_B T} > 1$$

$$\frac{\mu_B}{k_B} = 0.67 \frac{\text{K}}{\text{T}}$$

Atom Trapper's Periodic Table

-  Ground state could be magnetically trapped
-  Filled d-shell hydrogen-like atoms
-  Ground state has been magnetically trapped
-  High magnetic moment ($\mu \approx 5$), slightly submerged shell isotropic atoms
-  Ground state has been trapped in a MOT
-  Buffer gas cooled but not trapped
-  Excited state has been trapped in a MOT

Basics of Buffer Gas Cooling

$T \approx 1000K$

$T \approx 100\text{ mK}$

- ^3He buffer gas
- Paramagnetic Atoms

Thermalization ~ 100 collisions in
 $300\mu\text{s}$

$$n_{\text{BG}} = 10^{16}\text{ cm}^{-3}$$

Trapped Atoms!

Limits of Buffer Gas Cooling

Although trapped...

- ❑ Thermally connected to walls by buffer gas
- ❑ Atoms can undergo collisions to put them in an untrapped state

BG Effects on Trap Lifetime

BG Effects on Trap Lifetime

BG Effects on Trap Lifetime

Elastic vs. Inelastic Collisions

BG Effects on Trap Lifetime

BG Effects on Trap Lifetime

Buffer Gas Cooling and Trapping Requirements

1. Cold non-magnetic buffer gas
 - ✓ He thermalized by dilution refrigerator ($\sim 100\text{mK}$)
2. Atomic/Molecular source
 - ✓ Ablation, discharge, gas beam
3. Large magnetic field.
 - ✓ 4T superconducting magnet
 - ✓ 2.7K trap depth $\leftrightarrow \eta \sim 5-10$
4. Method to remove buffer gas
 - ✓ Fast cryogenic valve

Buffer Gas Loading Scheme

Ablate target ~ 1000 K

Thermalize and further cooling ~ 150 K

Open valve to remove buffer gas

Study atoms

Absorption Spectroscopy

Li Trapping: $1\mu_B$ S-state atom

Demonstrated first buffer gas cooling and trapping of $1\mu_B$ atoms!

The Noble Metals

	Cu	Ag	Au
Ground state config.	$3d^{10}4s$	$4d^{10}5s$	$4f^{14}5d^{10}6s$
Z	29	47	79
$\lambda(\text{nm})$	327	327	243

- All are hydrogen like $^2S_{1/2}$ ground states.
- Atomic masses are more favorable than Li for trapping.

Trapped Ag, Cu

Probe $^2S_{1/2} \rightarrow ^2P_{3/2}$
(328 nm)

Ag 1/e lifetime ~ 2.5 s

Probe $^2S_{1/2} \rightarrow ^2P_{3/2}$
(325 nm)

Cu 1/e lifetime ~ 5 s

Elastic vs. Inelastic Collisions

S-state vs. non-S-state

Elastic to Inelastic Ratio

Inelastic = trap loss
Elastic = thermalization

$$\tau_d = \frac{1}{n\sigma_{el}v_{th}}$$

$$\gamma = \frac{\sigma_{el}}{\sigma_{in}}$$

$\gamma > 10^4$ for possible trapping

Ratio is an indicator of anisotropy.

Or how S-like a many-electron atom is!

BG Effects on Trap Lifetime

Ag Trap Lifetime vs. τ_d

Temperature Dependence

$$\gamma_{\text{Ag}}, \gamma_{\text{Cu}} > 10^6$$

S-state
behavior
confirmed

$$\gamma_{\text{Ag}} \sim T^6$$

Not
expected

Brahms, N., et. al. -- submitted.

Conclusion

Successfully trapped $1\mu_B$ Li, Cu, Ag using buffer gas cooling

1. Lithium

- $>10^{12}$ atoms trapped at $T \sim 150$ mK
- Lifetimes ~ 200 seconds

2. Cu, Ag

- $>10^{12}$ atoms trapped at $T < 500$ mK
- Lifetimes ~ 5 s
- Anomalous Ag inelastic collision dependence on temperature

Removal of the Buffer Gas

- Thermal isolation
- Lengthen trap lifetime
- Study intra-atomic collisions
- Evaporative cooling to possible quantum degeneracy

Rare Earths

La	Ce	Pr	Nd	Pm	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

Non S-state -- but repressed anisotropy¹

High magnetic moments
